

The SIM Authentication Workshop

An Initiative of the IDM Forum in collaboration with Axalto

3rd November, Telenor at Fornebu, Norway

Invitation

As more and more mobile phones found their way to people's hearts, as many SIM cards found their way to people's pockets. But, while the mobile phone often belongs to the user, the SIM card remains the mobile operators' property. As the name says, the Subscriber Identity Module (SIM), was originally intended to carry the subscriber's identity and authentication functions. But, its strategic role was rapidly discovered and more operator specific applications are now put in the SIM to obtain differentiation from other operators. However, as a smart card and a tamper resistant device, the SIM card is better suited for security services. If the SIM card can be extended to offer authentication to other user applications running on the mobile phones or also on a computer, it will become an extremely valuable asset for the mobile operator.

The IDM FORUM would like to invite you to the SIM Authentication Workshop, where state-of the art SIM technologies and diverse SIM authentication schemes will be presented and explained by experts from Axalto, the world's leading provider of microprocessor cards. The Workshop will also serve as a meeting place for Telenor 's technical, business, marketing and sales experts in SIM cards, mobile terminals, mobile commerce and mobile services.

Workshop Program

Thursday 3rd November – Location: e-Cinema at B1e

- 9.00 - 9.05 Welcome
